Client Portal Launch Workshop

The portal is live and doing real work. We walk it through together — then it's yours for the week.

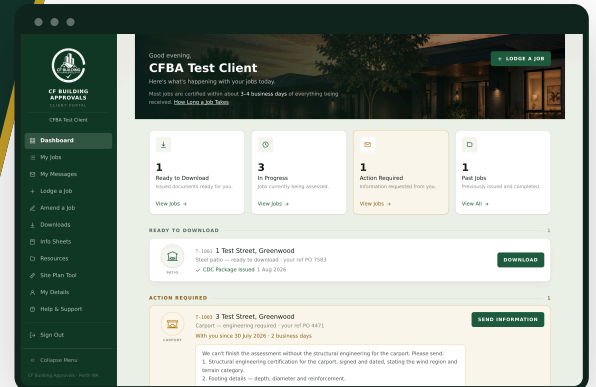

OUR GOAL THIS WEEK

Everyone uses the portal as a client and as staff at least once, and anything that felt wrong gets written down. Ten small problems found now beats a tidy meeting.

📅 Tuesday 4 August 2026

👤 Kacie · Chris · Rebecca · Fiona

🕒 Allow 90 minutes

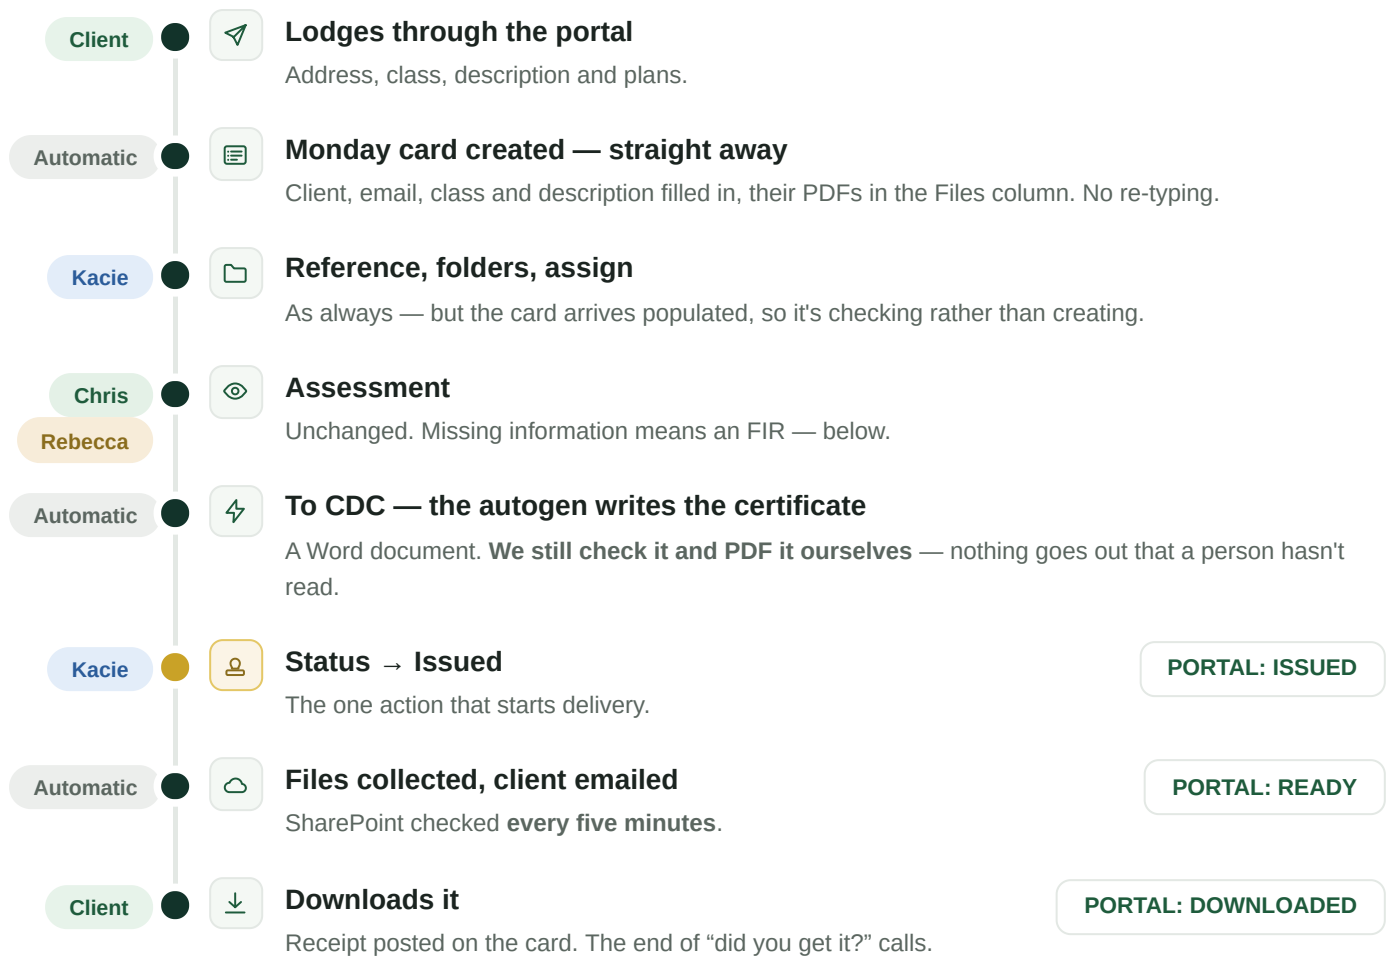

WHAT A CLIENT SEES WHEN THEY SIGN IN

TODAY'S AGENDA

	Where we're up to	The client's side	One job, end to end	An FIR, worked	Amendments changed	Our side + security	Monday + autogen	Your trial this week	
	5 min	15 min	20 min	10 min	10 min	15 min	10 min	5 min	
5 min		Where we're up to							Chris
		What's live, what's still coming, what we're deciding this week.							
15 min		The client's side							Chris
		Signing in, lodging, messages, downloads, resources, and the tools we've given them. Pages 5–6							
20 min		One job, start to finish							All
		A single job walked the whole way through on screen. Stop me anywhere. Page 2							
10 min		An FIR, worked through							Chris
		Saves us the most time, and most likely to catch us out. Page 2							
10 min		Amendments — this one has changed							All
		They no longer touch the board. Affects Kacie, Chris and Rebecca directly. Page 4							
15 min		Our side, and keeping it safe							Chris
		The eight admin pages, and what protects a client's files. Pages 7–8							
10 min		Monday and the CDC autogen							Chris
		What's automatic, what PORTAL is telling you, what still needs a person. Page 3							
5 min		Your trial this week							All
		Who does what, and how to tell me what you find. Page 5							

01 One job, start to finish

The same eight steps every job takes. Three are ours; the rest happen without anyone.

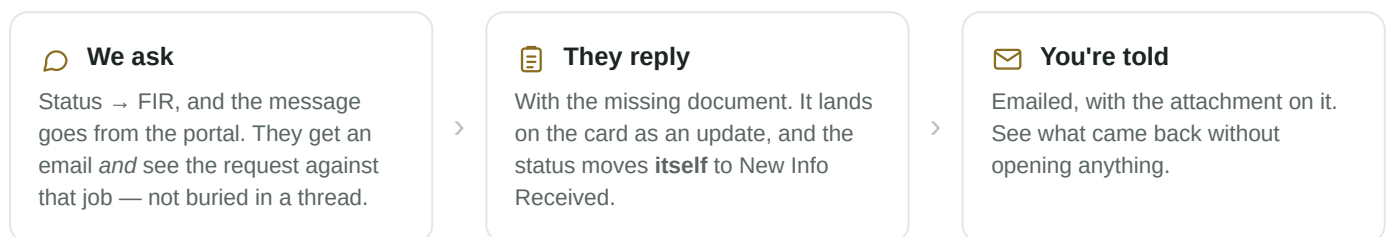

WHAT THE BOARD NOW TELLS YOU

STUCK — it hasn't got there and somebody needs to look. Also on the 5pm report.

AN FIR, WORKED THROUGH

Back to assessment. That automatic status move is the point — an answered job stops sitting in the FIR group looking like it's still waiting on them. **Watch this one on Tuesday:** if a status doesn't move itself, say so straight away. A job that goes quiet here costs a client a week.

What runs without anyone

Nobody presses these. They matter most on the days we're too busy to notice.

Every 5 min

Collects issued packages,
emails clients, moves
PORTAL, delivers
messages

45 minutes

An issued job with no files
is flagged STUCK

3 days

A ready package still
unopened is chased

5pm weekdays

The report, and the past-
jobs lists rebuild

Monday 7am

A digest to each client with
anything outstanding

AND THE MOMENT IT HAPPENS

	A job is lodged	Card created, files attached, client acknowledged.
	A client replies	Onto the card, status off FIR, office emailed.
	An amendment	Emailed to the certifier. Never on the board — over the page.
	A download	Receipt on the card, PORTAL to DOWNLOADED, retention clock starts.
	Still a person	Checking the autogen's Word document, PDF-ing it, and setting the status to Issued.

THE 5PM REPORT — WHAT IT'S FOR

Everything else in the portal reacts to something happening. This is the one thing that looks for something that *should* have happened and didn't — the job that never reaches the client, which is the only failure here that costs somebody a week and never announces itself.

	Issued, not delivered	On the board at Issued, nothing in the portal.
	Delivered, not told	The portal has it; the email didn't send.
	Ready, not opened	Three days and they still haven't looked.
	Amendments waiting	Lodged, nothing sent back — the board can't see these.
	No certificate	A package with everything except the CDC itself.
	Lodged, not on the board	The client believes it's with us.

It goes out at 5pm on weekdays whether there's anything in it or not, and the same items appear in Teams as they happen. **A quiet report is the good outcome** — but an empty inbox at 5pm means the report itself didn't run, so say something.

03 Amendments — what's changed

The only process in this pack that works differently from last week.

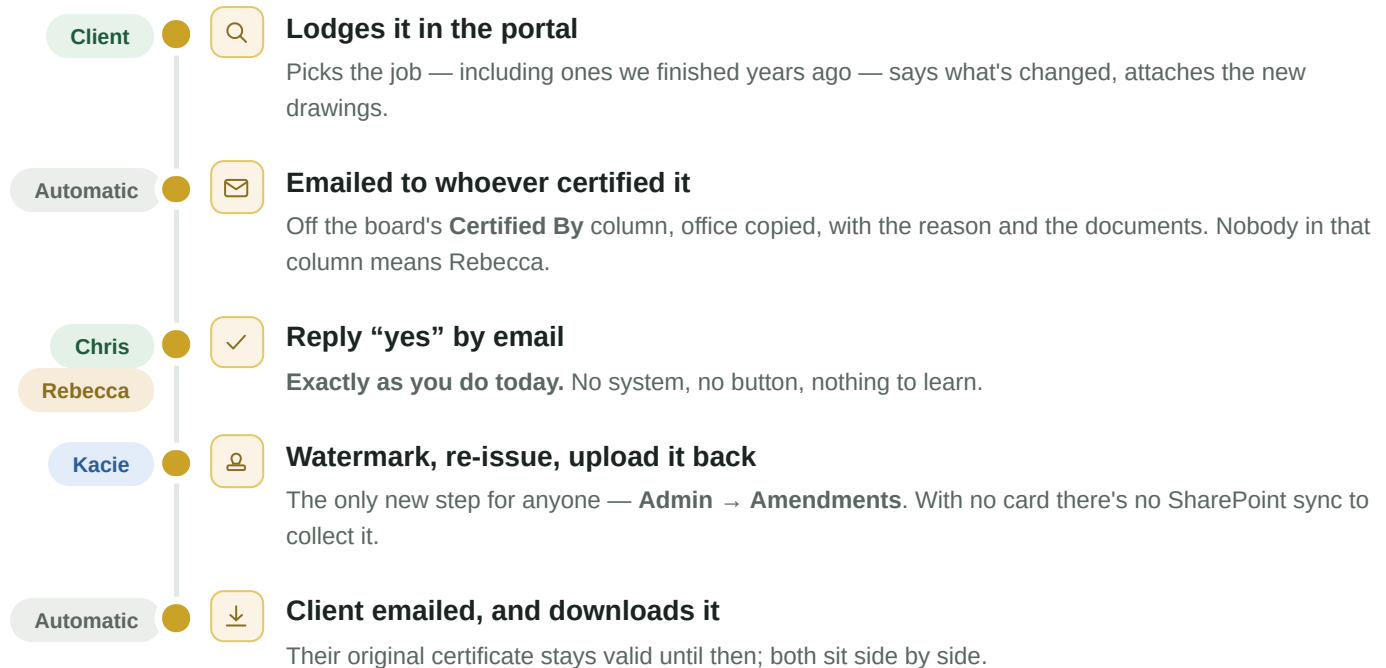

⊘ UNTIL NOW

- Opened a **new job on the board**
- Sat there looking like an assessment
- Waited its turn behind real jobs
- Took longer than doing it by email

✓ FROM NOW

- **Never touches the board**
- Emailed to whoever certified it
- You reply “yes” — as you do today
- One note on the original card

HOW ONE MOVES

WHAT IT MEANS FOR EACH OF YOU

	Kacie (blue circle)	You stop forwarding them — the email arrives at the right person already. You still watermark and re-issue exactly as now, then upload it on the Amendments page.
✓	Chris (green circle) Rebecca (orange circle)	Nothing changes. The request reaches you directly with the reason and the drawings attached; you reply “yes” by email as you do today.
	The board (grey circle)	Gets one note on the original card and nothing else. No new item, no status, no invoice.

 **The catch.** Because they're off the board, the board can't notice one going quiet — the 5pm report does instead. If you get an amendment email and it isn't yours, say so rather than leaving it.

04 What a client can do

Their sidebar, top to bottom. Any of it switches off from Settings while we update it, without taking the portal down.

	Dashboard	Every job and what stage it's at, on one screen.
	My Jobs	One job in detail — stage timeline, who's assessing, how long it's been with us.
	My Messages	A thread per job, newest first. Attachments both ways. Where an FIR is answered.
	Lodge a Job	Address, class, description, PDFs — plus anything saved in My Details. Straight onto the board.
	Amend a Job	A change to any job we've done — current or long finished. By email, never onto the board.
	Downloads	Every package we've issued them, as often as they like.
	Info Sheets	The fourteen guidance notes.
	Resources	Council forms, wind classification checker, bushfire map check, maps, and all thirty councils.
	Site Plan Tool	Draws a compliant site plan for a simple job, rather than us sending it back for one.
	My Details	Contact details, and a library of documents they reuse job to job.
	Help & Support	How it works, and a general enquiry that reaches us even when it isn't about a job.

Plus: first sign-in with a one-time code · password reset · unread counts · cancel a lodged job · export their job list · works on a phone, which is where most of them lodge from. The engineering checker is built and hidden until we switch it on.

YOUR TRIAL THIS WEEK

You each get a client login too. Please get through this by **Friday**, on a test job rather than a live one.

- | | |
|---|---|
| ☐ Sign in with the code you're emailed | ☐ Lodge an amendment on a completed job |
| ☐ Set a password, sign out, sign back in | ☐ Download a package, open the zip |
| ☐ Lodge a job with plans attached | ☐ Send a general enquiry |
| ☐ Check it appeared on the board | ☐ Try it on your phone |
| ☐ Send a message about a job | ☐ Look at Resources — forms, wind, bushfire |
| ☐ Answer an FIR with a document | ☐ Try to break it. Wrong password, huge file |

 **Tell me the same day** if something's broken — don't wait for Friday. Write the clumsy things down as you go; you won't remember them later. What you did, what you expected, what happened. **Friday:** fifteen minutes on what everyone found.

05 The tools we've given them

Each one exists because of a question we answer over and over, or a job we send back.

	Address, typed once	The address completes itself as they type — Australian addresses only, weighted to the slab of WA we certify in. The spelling and the suburb come from Google rather than from a builder on a phone, so “ <i>lot 42 smith st</i> ” stops arriving without a suburb.
	Site Plan Tool	Draws a compliant A4 site plan at a real scale, starting from the actual lot boundary out of the State's cadastre. North arrow, scale bar, dimensions to every boundary, title block. For the simple jobs we'd otherwise send back for a plan.
	Wind classification checker	Region, terrain, shielding and topography in — the AS 4055 wind class out, straight off the Stratco design guide tables. It shows its working, and says so plainly when the combination isn't one the tables cover.
	Bushfire map check	Puts their address straight into Landgate's bushfire-prone map. Answers “do I need a BAL assessment?” before they lodge instead of after.
	Council forms	BA1, BA2, BA5, BA7, BA9, BA13, BA19 and BA22 — Word or PDF, ours to keep current, with a link to the official source beside each so nobody works from a stale copy.
	All thirty councils	Every local government we deal with, each with a direct link to its building application page — not its home page.
	The fourteen info sheets	Site plans, engineering, BAL, retaining, elevations, amendments, the lodging checklist, boundaries, pool barriers, wind and site class, stormwater, easements, after the permit, and planning approval for Class 10.
	Engineering checker	Built and hidden. Switches on from Settings the day we decide it's ready — for clients, or just for us.
	Their document library	The documents they reuse job to job, kept in My Details and attachable to a lodgement without going and finding the file again.

- ☉ None of these decide anything either. They put the right answer in front of a client at the moment they'd otherwise guess — which is the moment a job starts going wrong. **Every one of them is worth five minutes on Tuesday**, because a tool nobody knows about is a tool we still answer the phone for.

WHAT TO SAY WHEN THEY RING

“What wind class am I?”

Resources → Wind Classification. Twenty seconds, and they get the answer with the reasoning under it rather than a number they have to trust.

“Do I need a BAL?”

Resources → Bushfire Map Check. Their address goes straight into Landgate's map, so it's the State's answer and not ours.

“My site plan came back”

Site Plan Tool. For a simple job it draws one properly — faster than explaining what was wrong with the last one.

GETTING IN

✉	A one-time code	Emailed with their username, and good for one use. They set their own password; we never choose one for them and never see it.
👤	Passwords we can't read	Stored scrambled, one-way, with a different scramble for each password. Nobody who took the whole database could turn them back into passwords — including us.
🕒	Guessing gets slower	Three wrong tries, then the wait grows: five minutes, half an hour, two hours. Counted against the username on our server, so moving to another computer doesn't reset it.
🕒	How long they stay in	Thirty days on a device they ask to be remembered on; twelve hours for our staff.

THEIR FILES

📁	Nothing has a public link	Every file lives in private storage. There is no address you could paste to somebody that would hand them a certificate — each download is checked against who's asking.
👁	A wrong guess tells you nothing	Somebody else's reference and a reference that doesn't exist give exactly the same “not found”, so the portal can't be used to work out what we hold.
📄	What can be uploaded	PDFs only. Up to 40 MB across 30 files on a lodgement, 25 MB on a message — checked on our side, not just in the browser.
🔄	Issued packages don't sit forever	Their copy is cleared after three months. Ours doesn't move — the certificate stays with us and on SharePoint exactly as it always has.

ON OUR SIDE

- Staff sign in separately — a client session can't reach an admin page
- **View as Client** shows us what they see, without their password
- The activity log records who did what, and when
- The key that reaches storage never leaves our server

- ⊘ **And what it deliberately doesn't do.** No card details and no payments, anywhere. No client can see another client's jobs, files or messages — that check runs on every request, not just on what the menu offers. And nothing about a job's outcome is ever written by the portal: it delivers what we wrote, and tells people it's there.

IF A CLIENT ASKS — AND THEY WILL

🗋	“Who else can see my plans?”	Nobody. Only your login reaches your jobs, and we check that on every file.
🗋	“What if I lose my password?”	Ring us and we'll send a fresh code. We can't tell you the old one — we can't see it either.
🗋	“How long do you keep it?”	Your download stays for three months. Our copy of the certificate we keep as we always have — ask any time and we'll re-issue it.

07 What we can do

The admin dashboard — eight places, and what each of them is for.

	Queue	Lodgements waiting to be accepted. Normally empty — a job goes straight onto the board. Anything here means Monday was down when they pressed Lodge.
	Clients	The registry. Issue a login, email the details and one-time code, reset a password, check their SharePoint folder resolves, view the portal as them, remove a client.
	Enquiries	Questions with no job behind them; the reply goes back through the portal.
	Amendments	Every one lodged, who it went to and why, and where the revised certificate goes back out from.
	Content	The welcome guide, info sheets, council forms and engineering sets — new versions any time, no redeploy.
	Settings	What's connected, the evening report, Teams notifications, amendment routing, switching client pages on and off.
	Turnaround Reports	How long jobs are taking, by class, with the days spent waiting on the client taken out.
	Activity Log	Who did what, and when. Sync Now sits beside it, for when five minutes is too long to wait.

BEFORE THE FIRST REAL CLIENT

- | | |
|---|---|
| ☐ Chris Amendment routing in Settings, then Rebuild Now — until both are done, Amend a Job stays off | ☐ The portal on our own domain rather than the build address |
| ☐ Kacie Upload the council forms — BA1, BA2, BA5, BA7, BA9, BA13, BA19, BA22 | ☐ Privacy wording signed off before anyone real signs in |
| ☐ All Read the fourteen info sheets with a red pen. They go out under our name | ☐ One live job carried the whole way through, watched |
| | ☐ Teams notifications unmuted |

DECISIONS WE NEED TODAY

	Who goes first	Which client, and what week. One we can ring if something looks odd.
	How far back they see	Every job we've ever done for them, or only the current ones?
	The engineering checker	On for clients, or ours only to begin with?

-  **The one thing to remember:** the portal never decides anything. It moves files, tells people, and keeps the board honest about where a certificate actually is. Every judgement is still ours.
