

Elevations — What Yours Need to Show

Every dimension we have to check, on the drawing itself.

Elevations are where height, clearance and pitch get checked, and where a missing figure stops an assessment. The two below are typical — an attached patio and a freestanding shed — with the dimensions we look for marked on them.

WHAT WE NEED TO SEE

- ✓ Every elevation that shows the works — usually all four for a freestanding structure
- ✓ Overall height measured from **natural** ground level, not the slab
- ✓ Wall height, or clearance to the underside of the beam
- ✓ Roof pitch or fall stated as a figure, not just drawn
- ✓ Post and column positions, dimensioned
- ✓ Natural ground line, plus finished floor or slab level
- ✓ The fixing detail where it attaches to the dwelling, or a reference to it
- ✓ Materials and finishes
- ✓ Scale, or a note that the drawing is not to scale

COMMON REASONS WE COME BACK

- ✗ Only one elevation supplied for a freestanding structure
- ✗ Overall height taken from the slab rather than natural ground
- ✗ Roof pitch drawn but never stated as a figure
- ✗ Natural ground line left off on a sloping site
- ✗ Post spacing not dimensioned, so it can't be checked against the engineering
- ✗ Elevations that don't match the floor plan they came with

Heights are measured from natural ground level, not the slab. On a sloping site, show the ground line across the full elevation. It is regularly the difference between a job going straight through and one coming back.
