

How a job flows, start to finish

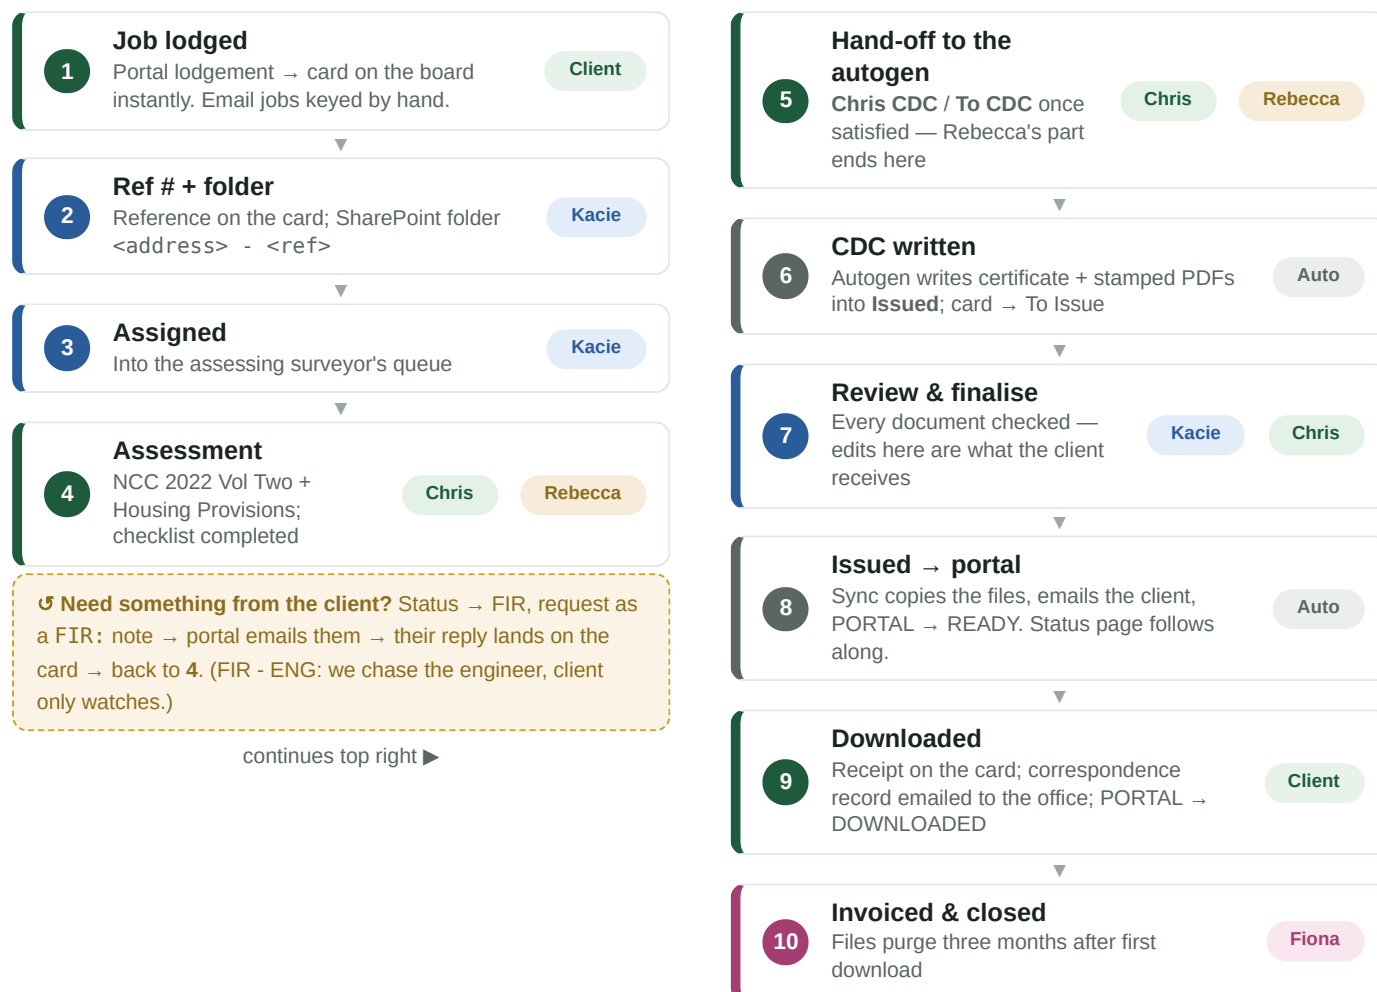

CF Building Approvals — internal reference

Updated August 2026 · Inspections not covered · Monday board · SharePoint · CDC autogen · client portal · public status page

WHO DOES WHAT

Kacie	Intake, references, folders, assigning, finalising, issuing, and all of Rebecca's admin
Chris	Assesses his own jobs, requests information, finalises and issues
Rebecca	Assessment only — her signature is already on the template
Fiona	Invoicing
Client	Lodges jobs, sends information, downloads
Automatic	Card creation, autogen, portal sync (every 5 minutes), emails, filing, receipts, purge

THE WHOLE FLOW AT A GLANCE

Colour = who acts. The detail for every step is over the page.

THE STAGES

- 1

Job comes in — straight onto the board

Automatic Client

Client lodges through the portal — address, structures picked from a list (class and description write themselves), plans and engineering. The Monday card is created **instantly** in New Jobs — client name, email, class and description filled, the PDFs in the card's **Files column**, the client's note posted to Updates. **Lodge Similar** pre-fills a repeat job (never the address). The review queue only holds a lodgement if Monday was unreachable at that moment. Jobs still arriving by email are entered by hand as they are now.
- 2

Reference number & folder

Kacie

Reference goes on the card and the SharePoint folder is created as `<address> - <ref>`. **Until the reference exists the portal cannot find the folder**, so nothing can be issued to the client.
- 3

Assigned to a surveyor

Kacie

Put into the assessing surveyor's queue. Chris assesses his own jobs; Rebecca assesses hers.
- 4

Assessment

Chris Rebecca

Plans and engineering assessed against NCC 2022 Volume Two and the ABCB Housing Provisions, and the checklist completed. This is where the work happens — the job stays here until the surveyor is satisfied.
- 5

Further information needed → see the loop overleaf

Chris Rebecca

Only when something is needed **from the client**. Status set to **FIR** and the request written on the card's Updates tab starting with `FIR:` (or `CLIENT:` — both work). Everything else on that card stays internal.
- 5b

Waiting on the engineer (FIR - ENG)

Chris Rebecca

Arranged **in house** — the client is shown the status so they know where the job is up to, but is never asked to supply anything or chased for it.
- 6

Assessment complete — hand off to the autogen

Chris Rebecca

The surveyor sets **Chris CDC** (Chris's jobs) or **To CDC** (Rebecca's) once the assessment is finished. **Rebecca's part ends here** — her signature is already on the template.
- 7

CDC generated automatically

Automatic

Setting the CDC status starts the script. It writes the certificate and watermarked PDFs into the job's **Issued** folder and moves the card to To Issue. Nobody types the certificate.
- 8

Reviewed and finalised

Chris Kacie

Every document checked against the CDC: correct references, watermark, address, and that **all documents are included**. Edits made here are what the client receives — the portal only takes files once the job is marked Issued.
- 9

Issued to the client

Chris Kacie Automatic

Sync copies the Issued folder into the portal, the job moves to **Ready to download**, and **the portal emails the client**. As it delivers it keeps the card's **PORTAL column** honest — ISSUED → READY → DOWNLOADED, or STUCK — which the public status page reads out. First download: receipt note on the card, and the office is emailed the job's **correspondence record** for the 7-year file.
- 10

Invoiced

Fiona Automatic

Job closed out. Downloaded jobs stay available to the client for **three months**, then the stored files are purged automatically.

Three things that stop a job dead. A card with **no reference number** cannot be matched to its SharePoint folder, so nothing reaches the client. A card whose **Client spelling matches no portal client** is invisible — its jobs and messages reach nobody; the admin page lists these under *Unmatched* with a one-click fix. And a job set to **FIR without a FIR: / CLIENT: update** shows the client "further information required" with no detail and sends no email. **FIR - ENG is not part of that loop** — the client is informed, not asked.

WHEN WE NEED MORE INFORMATION FROM THE CLIENT

- 1

Surveyor Chris

Sets status to **FIR** and posts the request on the card's Updates tab beginning **FIR:** (or **CLIENT:**). This loop is for information needed **from the client only**. The prefix works on a card in *any* active status — FIR is what flags "action needed".
- 2

Portal Automatic

Next sync (≤5 minutes) imports the update, shows the job under **Further information required**, then emails the client the request with a link straight to the job. The email is sent by the portal, not Monday, so it can never arrive before the detail is visible.
- 3

Client Client

Signs in, sees exactly what is needed, and uploads it against the job. No email chain.
- 4

Portal Automatic

Posts the reply and files onto the card, **and emails the office** that a reply has arrived — Monday doesn't notify us of updates made with our own token, the email does. Files land on the card with the message.
- 5

Surveyor Chris

Picks the job back up and carries on.

WHAT HAPPENS ON ITS OWN, AND WHAT DOES NOT

Automatic

- ✓ Monday card created at lodgement, files attached
- ✓ CDC and stamped PDFs generated
- ✓ Issued files copied to the portal
- ✓ "Certificate ready" email to the client
- ✓ Further-information email to the client
- ✓ Office email when a client replies
- ✓ Download receipt noted on the card
- ✓ PORTAL column kept honest as delivery happens — the public status page reads it
- ✓ Correspondence record emailed to the office on first download (7-year file)
- ✓ Sync health + unmatched list on /admin; the 5pm report
- ✓ Files purged three months after first download

Still done by us

- Reference number and folder
- Assigning the surveyor
- The assessment itself
- Writing the **FIR:** request
- Reviewing and finalising the pack
- Clicking Issued
- Invoicing
- Matching new client spellings (one click, /admin)

CHANGED AFTER ISSUE — THE AMENDMENT LOOP

An amendment **never opens a Monday card**. The client lodges it from the job's own page (or **Amend a Job**); the portal emails whoever is in the card's **Certified By** column with the office copied — Rebecca when the column is empty — and the reply happens by email exactly as before. Kacie watermarks and re-issues as usual, then uploads the revised certificate on **Admin** → **Amendments** (no card means no SharePoint sync to collect it). The original card gets one note; the client sees progress on the job itself and both certificates side by side in Downloads. The 5pm report is what notices a quiet one — admin guide (sheet 10) has the full rules and the routing setup.

A JOB FROM START TO FINISH — WORKED EXAMPLE

Mon 6 Jul	Complete Approvals lodge 89 Bannister-Marradong Road — Class 10a steel shed — through the portal. Card created instantly, plans in the Files column.	Client
Mon 6 Jul	Reference 56597 added; folder 89 Bannister-Marradong Road - 56597 created; assigned to Chris.	Kacie
Wed 8 Jul	Assessed. Raft slab engineering missing — request posted as FIR: ; portal emails the client within five minutes.	Chris
Fri 10 Jul	Client uploads the engineering; it lands on the card, office gets the reply email, card moves to New Info Received.	Client
Mon 13 Jul	Assessment completed → Chris CDC ; autogen writes the CDC and stamped PDFs into Issued.	Automatic
Tue 14 Jul	Pack reviewed and finalised; marked Issued . Portal syncs the files, sets PORTAL to READY, emails the client it's ready; they download the same afternoon — the card notes it, PORTAL flips to DOWNLOADED, and the office receives the job's correspondence record for the 7-year file.	Chris
Wed 15 Jul	Invoiced and closed. Anyone with the paperwork — the owner, the shire — can watch all of this on the public status page with just the reference and address.	Fiona

Coming soon: a send log on /admin (every email the portal sent, and any that failed — the answer to "did they actually get it?"), a client-side Team screen (clients disable their own departed logins), and an automatic bushfire-prone flag at lodgement.

Keeping this sheet current: the master is docs/collateral/09-job-flow-internal.html — edit it, run node render-pdfs.mjs , commit both. Re-check it whenever a Monday status label is added or renamed (the status page's map needs the same update — sheet 25), a step changes hands, or a new automatic step ships.
